## CIRCUIT DESCRIPTION

### RX Section

The front end unit is comprised of a dual gate MOS FET and helical resonator. The 2-stage MCF (Monolithic Crystal Filter) following the 1st mixer Q2 (3SK74) provides excellent 2-signal characteristic and high sensitivity.

The IF signal from the MCF is divided and applied to the SSB and FM circuits. The SSB signal passes through the NB (Noise Blanker) gate crystal filter (10H2.2SD) and is amplified by the transmit/receive IF amplifier, Q27, Q28 and 29, and is then demodulated into an audio signal by the product detector.

In the NB circuit, the signal from the MCF passes through the buffer amplifier Q6 and is fed to the 2nd mixer Q7. This signal is converted 455 kHz and the noise is amplified by two stages for switching the NB gate. The NB is front panel controlled.

In the AGC circuit, the signal from the final IF stage is detected and amplified, and the time constant is automatically select according to the mode of operation, FAST in CW mode and SLOW in SSB mode. The AGC signal is applied to the 3-stage IF amplifier, Q27, 28 and 29 (3SK74), and the RF amplifier Q1. The AGC voltage is also used for meter indication.

In the FM circuit, the signal from the ceramic filter CFW-455E is amplified by the IF amplifier Q13 (TA7302P). The auto scan stop signal is applied to the micro-computer from the squelch circuit.

The detected AF signal is amplified by the AF amplifier Q18, a 2SC1815(Y). The amplified signal passes through the LPF (Low Pass Filter) Q19, a 2SC1815(Y) and is power-amplified by Q26, (HA1366W) via the AF GAIN control to drive the speaker.

### TX Section

The microphone signal is amplified by the SSB/FM microphone amplifier Q1, a 2SC2240 (GR). This is then divided and fed to the SSB and FM circuits. SSB signal passes through the MIC GAIN control and is fed to the RX

## CIRCUIT DESCRIPTION

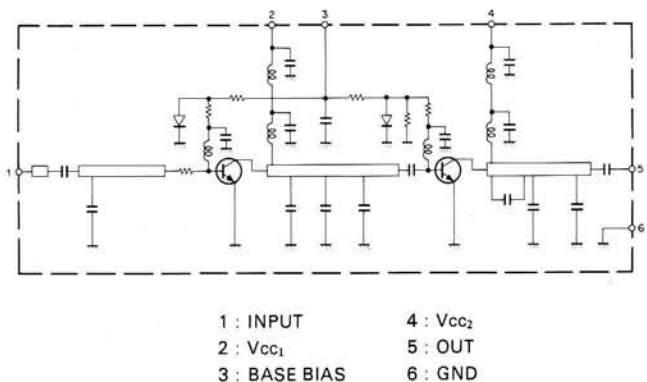

unit where the signal is amplified by two stages and is then applied to the balanced modulator together with the carrier signal (10.695 MHz). The DSB (Double Side Band) signal from the buffer amplifier Q37, a 2SK61 (GR) is fed to the transmit/receive crystal filter to produce an SSB signal. This signal is amplified and applied to the transmit balanced mixer, Q5 and Q6, 2SK61 (GR), in the TX unit. The FM signal is limiter-amplified by Q2 (TA7061AP) and is directly modulated by a 1S2208 diode. The modulated signal is applied to the mixer through the oscillator circuit Q3 (10.695 MHz) and buffer amplifier Q4 a 2SC460 (B). The remaining circuits are common to all the operating modes. The 4-stage BPF (Band Pass Filter) next to the mixer is used to eliminate unwanted spurious signals. After filtering, the signal is amplified by Q7, a 3SK74 (L) to drive the final unit via Q8 (2SC2538).

In the ALC circuit, the drive output from Q8 is amplified by Q9, a 2SC2603 (E) and is applied to the 2nd gates of the predriver Q7 and IF amplifier Q27.

The HI/LOW selection and protection in the FM and CW modes is accomplished by changing the source voltage of Q7, the predriver. In CW mode, the keying circuit controls the transmit balanced mixer B+ line and the base circuit of the predriver Q8 by the switching action of Q10, a 2SC1015 (Y). This signal, fed to the final unit, is power-amplified by the power module (M57713), and is then output to the antenna through, the LPF (Low Pass Filter). The M57713 is designed to provide excellent power, idle current, IMD and "f" characteristics, thus insuring stabilized performance.

## CIRCUIT DESCRIPTION

### PLL Unit (X50-1620-11)

Fig. 2 shows a basic block diagram of PLL circuit. The signal from the VCO (Q1, a 2SK19 (GR)) passes through the buffer amplifier formed by Q2, a 2SC1923 (O) and Q5, a 3SK74 (L), and is then mixed with the HET (Heterodyne) signal by Q13, a 2SC1923 (O) to produce 5.5 ~ 7.49 MHz signal. This signal is amplified by Q10, 11 and Q12, 2SC460 (B) and is frequency-divided by Q18 (TC9122P) according to the BCD data (MHz, 100 kHz and 10 kHz order) from the control unit, to produce 10 kHz comparison signal. Simultaneously, the 10.24 MHz signal from the RX unit is frequency-divided to 1/1024 by Q17 (TC5082P-GL) to produce 10 kHz reference signal. These signals are phase-compared by Q16 (TC5081P) and fed to the LPF formed by Q8 and Q9, and the resulting control voltage is applied to the VCO vari-cap tuning diode.

The 14.2 MHz VCO HET signal is generated by crystal oscillator Q6, a 2SC460 (B), and is then multiplied 9 times by D4 (1SS16) to produce a 127.8 MHz signal. This signal is then applied to the mixer, Q13, a 2SC1923 (O).

The crystal oscillator circuit has two vari-cap diodes to control frequency. A DC signal, corresponding to 0 ~ 9.9 kHz produced by the control unit (X53-1160-00), is voltage converted by Q7, a 2SK30A (GR) and is fed to the vari-cap D6 (1S2208) to control the frequency. The other vari-cap D5 (1SV50S) is used to shift the frequency ( $f_{USB} = f_{FM} + 1.5$  kHz,  $f_{LSB} = f_{FM} - 1.5$  kHz) according to the operating mode and to afford RIT (Receive Incremental Tuning) frequency.

Table 6. Functions of TC 9122P (PLL Unit : Q18)

### CONTROL Unit (X53-1160-11)

Fig. 8 shows the basic configuration of control unit. Utilizing the micro-computer to it's full advantage, this control circuit has been designed for a minimum of peripheral control circuits.

#### Indicator

The indicator is a dynamic lighting (scanning) type, using 5-digit LED's. The BCD code data available at the micro-computer D port (pins 8-11) is converted into 7-segment data by the decoder driver Q18 (TC5022BP), so that transistors Q5-9, 2SC1815 (Y) are switched (scanned) in sequence by the digit signal from the E and F ports (pins 12-16) and light the LEDs.

#### PLL Data Output

The PLL MHz, 100 kHz and 10 kHz order data outputs are available directly from the BCD code at the G, H and I ports (pins 22-32). For the 1 kHz and 100 Hz order data, only the indicator data (1 kHz and 100 Hz order) are stored in the dual latch, Q16 (MN1201A) to produce the data for each digit.

This 2-digit data is converted to a corresponding DC voltage by the D/A converter, a combination of solid resistors (R6-20).

The MHz, 100 kHz and 10 kHz order data are 550 at 4.00, 650 at 5.00 and 749 at 5.99, respectively (3-digit BCD code).

#### Reset Circuit

The reset circuit is a voltage detecting type. When the source voltage of the micro-computer is increased and exceeds about 3.5V, a current flows into D20, causing Q11,

## CIRCUIT DESCRIPTION

a 2SC1815 (Y) to turn ON, which in turn sets the collector of Q10, a 2SC1815 (Y) high, and a reset pulse is input to the micro-computer through the CR differentiation circuit.

- Encoder and UP/DOWN Inputs

Fig. 7 shows the output signal from the encoder # (50 steps per rotation). This signal is used to discriminate UP and DOWN counts within the micro-computer. The UP count starts when U/D is H level at the down edge of the clock signal, and the DOWN count when U/D is L level.

- Tone Oscillator Circuit

When the output for the micro-computer tone oscillator is H level, Q12, a 2SC1815 (Y) is energized, allowing a current to flow into the piezo-electric buzzer oscillator, Q13, a 2SC1815 (Y), producing a tone.

- Switching Circuit

Each of the switches in the control unit are used to select the control pulses output from the micro-computer. Fig. 8 shows a block diagram of the control unit. For actual operation of this unit, the micro-computer input and output terminals must be connected. The diodes (see circuit diagram) are used to prevent control pulses from entering the wrong circuits.

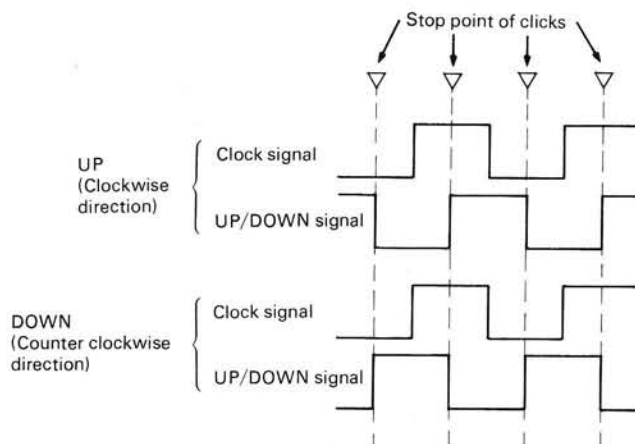

Fig. 6

Fig. 7 Rotary encoder (W02-0308-05)

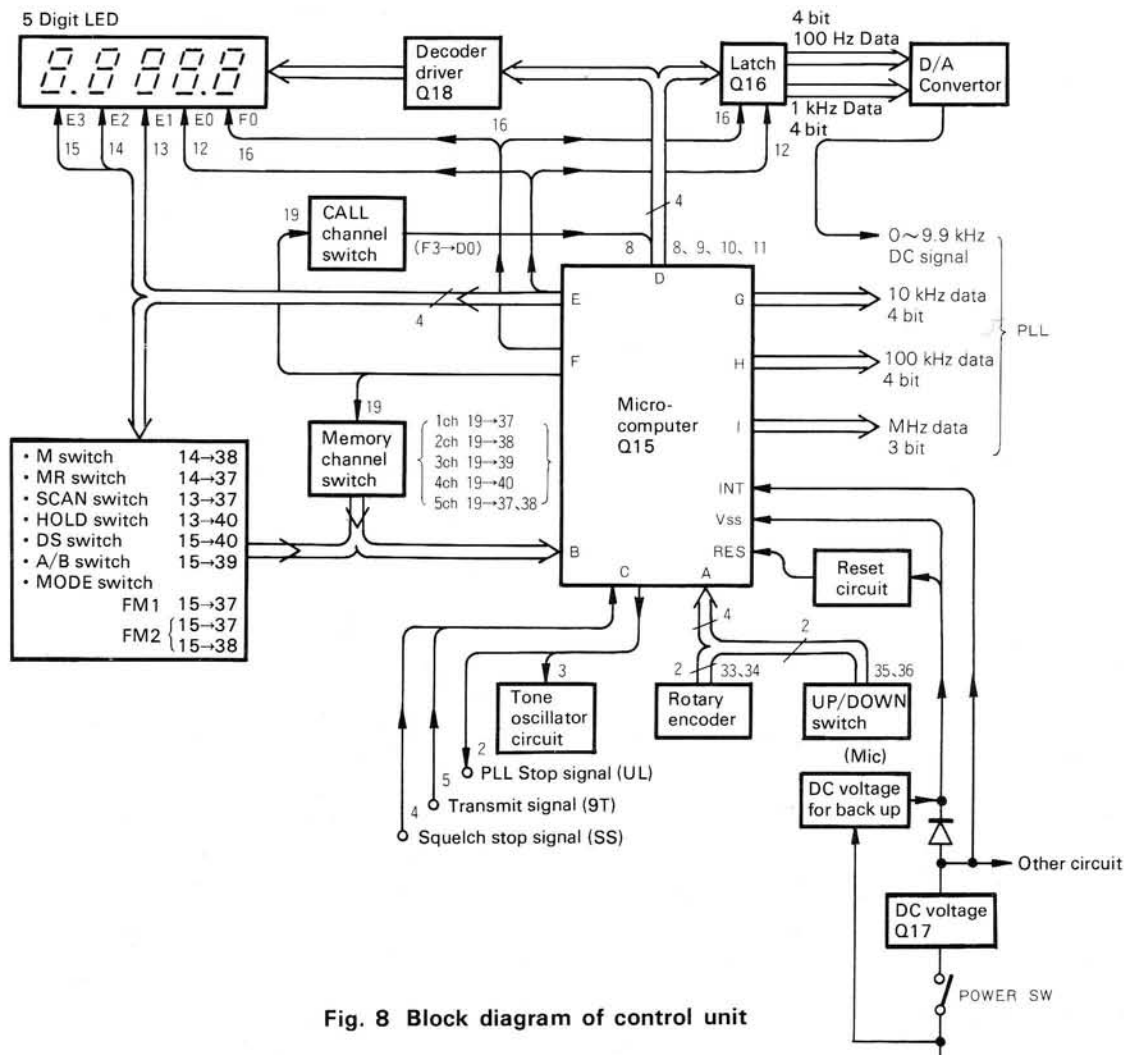

Fig. 8 Block diagram of control unit

## CIRCUIT DESCRIPTION

- Scan Circuit

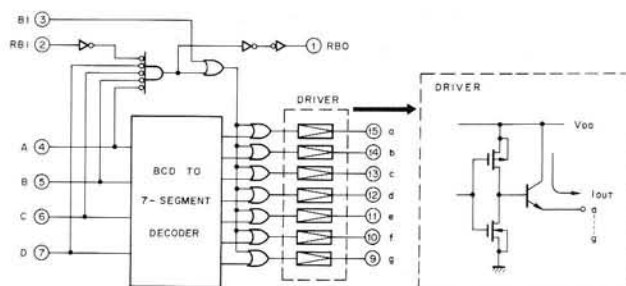

This circuit is active when the SCAN switch is depressed. During operation, counting and all other functions are effected within the micro-computer. The scan stops by pressing the HOLD switch or by setting the transmit signal (9T) to H level. The scan stops for a brief period of time when the squelch stop signal (SS terminal) becomes H level. This signal is used to stop the scan in 10 kHz or 20 kHz step. The changes in the 10 kHz PLL data each are differentiated as is or are inverted by Q19, 20 to obtain OR data so that pulses are output each time the data is changed. These pulses are applied to the micro-computer scan stop terminal (4) to slow down the scan operation.

- Control Power Circuit

The indicator operates on 5V available at transistor Q14, a 2SC496 (Y). The micro-computer operates on 6V supplied by the AVR (Automatic Voltage Regulator) IC, Q17 (NJM78L06K), supplied through a reverse current blocking diode, D11.

- Backup Circuit

When the POWER SW is turned OFF, the micro-computer operates from the backup power source when the micro-computer INT terminal (pin 6) is at L level. At this time, all

CIRCUIT DESCRIPTION

output ports become L level, minimizing power consumption. When the POWER SW is turned ON, the INT terminal and UP/DOWN input terminal become H level, and the micro-computer resumes at its original condition. The input port B (pins 37-40) is momentarily set to L level by Q2 and Q4 to insure backup operation even when other switches remain ON. Backup operation is also assured during scan operation, since the scan is stopped by Q3 when the POWER SW is turned OFF.

Symbol	Pin	Description

## PARTS LIST

## Note 1:

K: U.S.A. T: Britain W: Europe X: Australia

## Note 2:

Only special type of resistors (example: cement, metal film, etc.) and capacitors (example: electrolytic, tantalum, mylar, temp. coeff. capacitors) are detailed in the PARTS LIST. For the value of all common type components, refer to the schematic diagram of the P.C. board illustration. Resistors not otherwise detailed are carbon type (1/4W or 1/8W). Order carbon resistors and capacitors according to the following example:

A carbon resistor's part number is RD14BY 2E22J.

A ceramic capacitor's number is CK45F1H103Z, CC45TH1H220J.

## RESISTOR

## 1. Type of the carbon resistor

## 2. Wattage

1W → 3A      3W → 3F      5W → 3H  
2W → 3D      4W → 3G

3' = CC45 ○ ○ ...

Ceramic capacitor (type I) temperature coeff. capacitor 1' 3'.

1st word (Color)	C (Black)	L (Red)	P (Orange)	R (Yellow)	S (Green)	T (Blue)	U (Violet)
ppm/°C	0	-80	-150	-220	-330	-470	-750

3 = CK45 ○

Ceramic capacitor (type II) 3

Cord	B	D	E	F
Operating temperature °C	-30 +85	-30 +85	-30 +85	-10 +70

6 = Tolerance

Cord	C	D	G	J	K	M	X	Z	P	No cord
(%)	±0.25	±0.5	±2	±5	±10	±20	+40 -20	+80 -20	+100 -0	More than 10 μF -10 ~ +50 Less than 4.7 μF -10 ~ +75

Less than 10 pF

Cord	B	C	D	F	G
(pF)	±0.1	±0.25	±0.5	±1	±2

Abbreviation		Abbreviation	
Cap.	Capacitor	ML	Mylar
C	Ceramic	S	Styren
E	Electrolytic	T	Tantalum
MC	Mica		

## 3. Resistance value

② ② ② → means  $22 \times 10^2 = 2200\Omega$  (2.2 kΩ)  
Example: 221 → 220Ω      223 → 22 kΩ      225 → 2.2 MΩ  
222 → 2.2 kΩ      224 → 220 kΩ

## 4. Tolerance

J = ±5% (Gold)      K = ±10% (Silver)

## CAPACITORS

## Type I

CC 45 TH 1H 220 J      CK 45 F 1H 103 Z  
1' 2 3' 4 5 6      1 2 3 4 5 6

1 = Type .... ceramic, electrolytic, etc.      4 = Voltage rating  
2 = Shape .... round, square, etc.      5 = Value  
3 = Temp range      6 = Tolerance  
3' = Temp coefficient

Ex. CC45TH = -470 ±60 ppm/°C

2nd Word	G	H	J	K	L
ppm/°C	±30	±60	±120	±250	±500

CC45

Type I

CK45

Type II

## 5 = Capacitor value

Example: 010 → 1 pF  
100 → 10 pF  
101 → 100 pF  
102 → 1000 pF = 0.001 μF  
103 → 0.01 μF

## REFERENCE DATA

**[Near spurious response]**

CARRIER FREQ.: 145.02 MHz  
RF POWER: 10.5W  
SCAN WIDTH: 5 MHz/DIV  
BAND WIDTH: 10 kHz  
SCAN TIME: 0.5 sec  
VIDEO FILTER: 10 kHz  
INPUT ATT: 20 dB  
LOG REF LEVEL: -5 dBm  
10 dB/DIV

**[Harmonics spurious response]**

CARRIER FREQ.: 145.02 MHz  
RF POWER: 10.5W  
SCAN WIDTH: 100 MHz/DIV  
BAND WIDTH: 30 kHz  
SCAN TIME: 2 sec  
VIDEO FILTER: 10 kHz  
INPUT ATT: 20 dB  
LOG REF LEVEL: -5 dBm  
10 dB/DIV

## PS-20

## PS-20 SPECIFICATIONS

## [POWER SUPPLY SECTION]

Input voltage	AC 120/220/240V $\pm 10\%$ , 50/60 Hz
Output voltage	DC 13.8V (standard voltage)
Output current	4.5A (intermittent load 50% duty cycle)
Continuous load current	4A max.
Output voltage fluctuation	Within $\pm 50$ mV at AC120/220/240V $\pm 10\%$ (at load current 4A) Within 0.1V at 0~4A of load current (at AC 120/220/240V)
Ripple voltage	Less than 5 mV at 13.8V, 4A (at AC 120/220/240V)
Power consumption	Approx. 100W (at AC 120/220/240V, DC 13.8V, 4A)

## [GENERAL]

Dimensions	123 (4-27/32") W $\times$ 96 (3-25/32") H $\times$ 235 (9-17/64") D mm (inch)
Weight	Approx. 3.8 kg (8.4 lbs)

## [ACCESSORIES]

Operating manual	1
DC Power cord	1
Fuse (1A)	1
Crimp style terminal	2

NOTE: The circuit and ratings may change without notice due to development in technology.

Fig. 19 Output voltage characteristic

## LEVEL DIAGRAM

## &lt; RECEIVER SECTION &gt;

## Notes:

1. The figures shown are signal generator output required for a constant audio output with a constant AF gain control setting. Set the AF gain control for 0.63V/8Ω (50 mW) audio output -6 dB signal generator input at 144.50 MHz (MODE: CW)
2. The figures shown in □ are signal generator output required for a constant S/N ratio with a constant AF gain control setting -6 dB signal generator input at 144.50 MHz. (MODE: FM)
3. The figures shown after the ring detector are audio output levels.
4. To inject signal generator output connect a 0.01 μF 500V capacitor between the signal generator and the check point.

## &lt; TRANSMITTER SECTION &gt;

## Notes:

1. Levels before DO terminal are measured with VR5 turned fullclockwise and DO coaxial cable disconnected in TX unit (X56-1360-10)
2. All voltage measurements except MIC AMP section are read from on RF VTVM. Voltages in MIC AMP are measured by AF VTVM.

## &lt; REFERENCE &gt;

Japanese "SG"	American "SG"
-6 dB	0.25 μV
0 dB	0.5 μV
6 dB	1 μV
12 dB	2 μV
24 dB	8 μV
30 dB	15.8 μV
40 dB	50 μV
50 dB	158 μV
60 dB	500 μV
70 dB	1.58 mV
80 dB	5 mV
90 dB	15.8 mV
100 dB	50 mV
120 dB	0.5V

## ADJUSTMENTS

### < Test Equipment >

1. Tester
    - Input: Sufficient
  2. RF VTVM (RF V.M.)
    - Input impedance: 1 M $\Omega$  and less than 2 pF
    - Voltage range: F.S. = 10 mV to 300V
    - Frequency range: 150 MHz or greater
  3. Frequency counter (F count)
    - Minimum input voltage: 50 mV
    - Frequency range: 150 MHz or greater
  4. DC power supply
    - Voltage 10V to 17V variable
    - Current: 6A min.
  5. RF Dummy Load
    - Dissipation: 20W
    - Impedance: 50 $\Omega$
    - Frequency range: 144 MHz
  6. AF VTVM (AF V.M.)
    - Input impedance: 1 M $\Omega$  or greater
    - Voltage range: F.S. = 1 mV to 30V
    - Frequency range: 50 Hz to 10 kHz
  7. AF Generator (AG)
    - Frequency range: 100 Hz to 10 kHz
    - Output: 0.5 mV to 1V
  8. Linear detector
    - Frequency range: 144 MHz
  9. Field strength tester
    - Frequency range: 144 MHz
  10. Directional coupler
  11. Oscilloscope
    - With horizontal input and high sensitivity
  12. Standard signal generator (SSG)
    - Frequency range: 144 ~ 149 MHz
    - Modulation: amplitude and frequency modulation
    - Output: -20 dB ~ 100 dB
  13. AF Dummy load
    - 8 $\Omega$ , 5W (approx.)
- Noise generator
- Must generate ignition-like noise containing harmonics beyond 144 MHz
15. Sweep generator
    - Frequency range: 144 ~ 149 MHz

### < Preparation >

Unless otherwise specified, set the controls as follows.

POWER/VOL SW	ON
SEND/REC	REC
RF GAIN VOL	MAX (Full Clockwise)
SQUELCH VOL	MIN
MODE SW	USB
VFO A/B SW	A
TX OFF SET SW	S
HI/LOW SW	HI
RIT VOL	Centered
RIT SW	OFF
NB SW	OFF
SCAN SW	OFF
D.STEP/SEARCH	OFF
MR	OFF

#### Notes:

- When adjusting the trimmers or coils, use a non-induced adjusting rod of bakelite, etc.
- When adjusting the RX section never transmit to prevent SSG damage.
- Connect MIC connector as shown in Fig. 18.

Fig. 18 MIC terminals  
(view from front panel side)

# ADJUSTMENTS

Item	Condition	Measurement			Adjustment			Specification	Remarks
		Test equipment	Unit	Terminal	Unit	Parts	Method		
1. Voltage check in RX mode.	1 8C	DC V.M	TX	8C				7.7~8.3V	Check

### < Micro-computer operational check >

Control functions		Micro-computer functions			
<b>1. VFO A/B</b> 1 Disconnect power plug and re-connect after a 20 second delay. 2 VFO A/B SW: B  3 MR SW: ON MEMORY: 1 ~ 5 4 VFO A/B SW: A MR SW: OFF  <b>2. Dial step and indicator digits</b>		Indicates 6,000.0 (K,X) Indicates 5,000.0 (W,T) Indicates 4,000.0 VFO B indicator lights. Indicates 4,000.0.			
Destination Display, dial step	K	X	W	T	
MODE SW: USB-CW-LSB-FM2 Turn VFO dial	5 digits indication Indication changes in 100 Hz steps	←	←	←	
MODE SW: FM2 D STEP SW: ON Turn VFO dial	4 digits indication Indication changes in 5 kHz steps	←	4 digits indication Indication changes in 12.5 kHz steps	←	
MODE SW: FM1 D STEP SW: ON, OFF Turn VFO dial	3 digits indication Indication changes in 10 kHz steps	4 digits indication Indication changes in 25 kHz steps	←	←	
<b>3. Memory</b> 1 Write Set the controls as in Table 10. MEMORY SW: 1 ~ 5 2 Call MEMORY SW: 1 ~ 5 3 MEMORY SW: <u>5</u>		By pressing M SW, tone should be heard and the 5-digit data indicated should be stored in memory. By pressing MR SW, the 5-digit frequency should be displayed. Transmit and receive frequencies should be stored and called individually.			
<b>4. UP/DOWN</b> 1 Set the controls as in Table 10.		Press the MIC UP/DOWN switch once, the tone should be heard and the frequency will shift up or down step by step. Press and hold the switch, and the frequency will change rapidly with continuous tone.			
<b>5. Search</b> 1 MODE SW: USB-CW-LSB D STEP SW: ON (SEARCH) 2 Turn VFO dial.  3 Set in transmit mode. 4 D STEP SW: OFF Set in receive mode.		The frequency is searched between 0 and 9.9 kHz in 100 Hz steps. The frequency is shifted up or down in 10 kHz steps (quick shift). The search function stops.			
<b>6. Scan</b> 1 MODE SW: FM2 Squelch control: ON SCAN SW: ON 2 D STEP SW: ON (SEARCH)  3 Squelch control: Turn counterclockwise. 4 Squelch control: F.S. 5 Set in transmit mode. 6 Set in receive mode.		The frequency is shifted up in 100 Hz steps.  The frequency is shifted up in 5 kHz (K,X), 12.5 kHz (W,T) steps. BUSY indicator lights. Scan stops.  Scan restarts. Scan stops.

# SCHEMATIC DIAGRAM (W) (T)

# SPECIFICATIONS

## [K, X type]

### GENERAL

Semiconductors	ICs 12 FETs 16 Transistors 86 Diodes 141 (K), 142 (X)
Frequency range	144,000.0 to 147,999.9 MHz
Frequency synthesizer	Digital control, phase locked VCO
Mode	SSB (A3j), FM (F3), CW (A1)
Frequency stability	Within $\pm 500$ Hz during the first hour after 1 minute of warm up, and within 50 Hz any 30 minutes thereafter at 25°C (constant).
Power requirement	13.8V DC $\pm 15\%$
Grounding	Negative
Operating temperature	-20°C to +60°C
Current drain	0.4A in receive mode with no input signal 2.9A in HI transmit mode (Approx.) 1.3A in LOW transmit mode (Approx.)
Dimensions	Less than 2.5 mA for memory back up 170 mm (6-11/16") wide 68 mm (2-11/16") high 234 mm (9-3/16") deep (projections not included)
Weight	2.5 kg (5.5 lbs)

### TRANSMITTER SECTION

RF output power	HI (SSB, FM, CW) 10W (at 13.8V DC, 50 $\Omega$ load) LOW (FM, CW) 1W approx.
Modulation	FM Variable reactance direct shift SSB Balanced modulation
Frequency tolerance	SSB, CW Less than $\pm 10 \times 10^{-6}$ FM Less than $\pm 20 \times 10^{-6}$
Spurious radiation	HI Less than -60 dB LOW Less than -46 dB
Carrier suppression	Better than 40 dB
Unwanted side band suppression	Better than 40 dB
Maximum frequency deviation (FM)	$\pm 5$ kHz
Microphone	Dynamic microphone with PTT switch, 500 $\Omega$

### RECEIVER SECTION

Circuitry	FM Double conversion superheterodyne SSB, CW Single conversion superheterodyne
Intermediate frequency	1st IF 10,695 MHz 2nd IF (FM) 455 kHz
Receiver sensitivity	FM Better than 0.5 $\mu$ V for 30 dB S/N Better than 0.25 $\mu$ V for 12 dB SINAD SSB, CW 0.25 $\mu$ V for 10 dB S/N
Receiver selectivity	FM More than 12 kHz (-6 dB) Less than 25 kHz (-60 dB) SSB, CW More than 2.2 kHz (-6 dB) Less than 4.8 kHz (-60 dB)
Spurious interference	Better than 70 dB
Squelch sensitivity	0.2 $\mu$ V (threshold)
Auto scan stop level	Less than 0.25 $\mu$ V (threshold)
Audio output	More than 2.0 watts across 8 ohm load (10% dist.)

## [W, T type]

### GENERAL

Semiconductors	ICs 12 FETs 16 Transistors 87 (W), 88 (T) Diodes 142 (W), 144 (T)
Frequency range	144,000.0 to 145,999.9 MHz
Frequency synthesizer	Digital control, phase locked VCO
Mode	SSB (A3j), FM (F3), CW (A1)
Frequency stability	Within $\pm 500$ Hz during the first hour after 1 minute of warm up, and within 50 Hz any 30 minutes thereafter at 25°C (constant).
RPT Tone burst frequency	1750 Hz
Power requirement	13.8V DC $\pm 15\%$
Grounding	Negative
Operating temperature	-20°C to +60°C
Current drain	0.4A in receive mode with no input signal 2.9A in (HI) transmit mode (Approx.) (HI): (T) only (T) only ..... 1.3A in LOW transmit mode (Approx.)
Dimensions	Less than 2.5 mA for memory back up 170 mm (6-11/16") wide 68 mm (2-11/16") high 234 mm (9-3/16") deep (projections not included)
Weight	2.5 kg (5.5 lbs)

### TRANSMITTER SECTION

RF output power	(HI) (SSB, FM, CW) 10W (HI): (T) only (at 13.8V DC, 50 $\Omega$ load) LOW (FM, CW) 1W approx. (T) only
Modulation	FM Variable reactance direct shift SSB Balanced modulation
Frequency tolerance	SSB, CW Less than $\pm 10 \times 10^{-6}$ FM Less than $\pm 20 \times 10^{-6}$
Spurious radiation	(HI) Less than -60 dB (HI): (T) only LOW Less than -50 dB (T) only
Carrier suppression	Better than 40 dB
Unwanted side band suppression	Better than 40 dB
Maximum frequency deviation (FM)	$\pm 5$ kHz
Microphone	Dynamic microphone with PTT switch, 500 $\Omega$

### RECEIVER SECTION

Circuitry	FM Double conversion superheterodyne SSB, CW Single conversion superheterodyne
Intermediate frequency	1st IF 10,695 MHz 2nd IF (FM) 455 kHz
Receiver sensitivity	FM Better than 0.5 $\mu$ V for 30 dB S/N Better than 0.2 $\mu$ V for 12 dB SINAD SSB, CW 0.2 $\mu$ V for 10 dB S/N
Receiver selectivity	FM More than 12 kHz (-6 dB) Less than 25 kHz (-60 dB) SSB, CW More than 2.2 kHz (-6 dB) Less than 4.8 kHz (-60 dB)
Spurious interference	Better than 70 dB
Squelch sensitivity	0.16 $\mu$ V (threshold)
Auto scan stop level	Less than 0.2 $\mu$ V (threshold)
Audio output	More than 2.0 watts across 8 ohm load (10% dist.)

NOTE: Circuit and ratings are subject to change without notice due to developments in technology.
