**CAUTION:** THIS SERVICE MANUAL IS ONLY FOR PROFESSIONAL SERVICE PERSONNEL'S  
REFERENCE. BEFORE SERVICING THIS CHASSIS, PLEASE READ THE FOLLOWING  
NOTICE ITEMS.

## **SAFETY INSTRUCTION**

Before servicing and aligning this equipment, please read the following “**X-RAY RADIATION PRECAUTION**”, “**SAFETY PRECAUTION**” and “**PRODUCT SAFETY NOTICE**”.

### **X-RAY RADIATION PRECAUTION**

1. Excessive high voltage can produce potentially hazardous X-RAY RADIATION. To avoid such hazards, the high voltage must not be above the specified limit. The normal value of the high voltage of this receiver is 29 or 26.5kV(20") at zero beam current (minimum brightness) under 120V AC power source. the high voltage must not, under any circumstances, exceed 32kV.
2. Each time a receiver requires servicing, the high voltage should be checked following the HIGH VOLTAGE CHECK procedure in this manual. It is recommended the reading of the high voltage be recorded as a part of service record. It is important to use an accurate and reliable high voltage meter.
3. This receiver is equipped with a Fail Safe (FS) circuit which prevents the receiver from producing an excessively high voltage even if the B+ voltage increases abnormally. Each time the receiver is serviced, the FS circuit must be checked to determine that the circuit is properly functioning, following the FS CIRCUIT CHECK procedure in this manual.
4. The primary source of X-RAY RADIATION in this TV receiver is the picture tube. For continuous X-RAY RADIATION protection, the replacement tube must be exactly the same type tube as specified in the parts list.
5. Some parts in this receiver have special safety-related characteristics for X-RAY RADIATION protection. For continuous safety, parts replacement should be undertaken only after referring to the PRODUCT SAFETY NOTICE below.

### **SAFETY PRECAUTION**

#### **WARNING:**

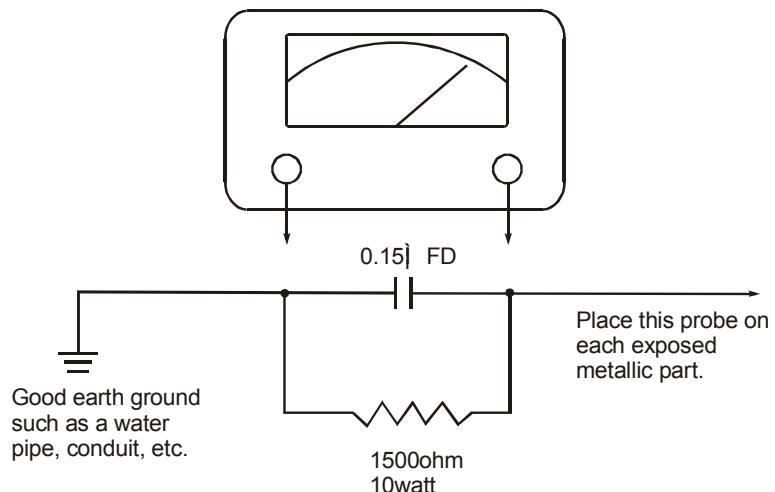

Service should not be attempted by anyone unfamiliar with the necessary precaution on this receiver. The following are the necessary precautions to be observed before servicing this chassis.

- 1) Since the power supply circuit of this receiver is directly connected to the AC power line, an isolation transformer should be used during any dynamic service to avoid possible shock hazard.
- 2) Always discharge the picture tube anode to the CRT conductive coating before handling the picture tube. The picture tube is highly evacuated and if broken, glass fragments will be violently expelled. Use shatter proof goggles and keep picture tube away from the unprotected body while handling.
- 3) When replacing a chassis in the cabinet, always be certain that all the protective devices are put back in place, such as: non-metallic control knobs, insulating covers, shields, isolation resistor-capacitor network etc.
- 4) When replacing parts or circuit boards, disconnect the power cord.
- 5) When replacing a high wattage resistor (oxide metal film resistor) on the circuit board, keep the resistor 10mm (1/2in) away from circuit board.
- 6) Connection wires must be kept away from components with high voltage or high temperature.
- 7) If any fuse in this TV receiver is blown, replace it with the FUSE specified in the chassis parts list.
- 8) Before returning the set to your customer, always perform an AC leakage current check on the exposed

metallic parts of the cabinet, such as antennas, terminals, screwheads, metal overlays, control shafts etc. to be sure the set is safe to operate without danger of electrical shock. Plug the AC line cord directly into a 120V AC outlet (do not use a line isolation transformer during this check). Use an AC voltmeter having 5000 ohms per volt or more sensitivity in the following manner:

Connect a 1500 ohm 10 watt resistor, paralleled by a  $0.15\mu\text{F}$ , AC type capacitor, between a known good earth ground (water pipe, conduit, etc.) and the exposed metallic parts, one at a time. Measure the AC voltage across the combination of 1500 ohm resistor and  $0.15\mu\text{F}$  capacitor. Reverse the AC plug at the AC outlet and repeat AC voltage measurements for each exposed metallic part. Voltage measured must not exceed 0.3 volts RMS. This corresponds to 0.2 milliamp. AC. Any value exceeding this limit constitutes a potential shock hazard and must be corrected immediately.

#### AC VOLTMETER

#### PRODUCT SAFETY NOTICE

Many electrical and mechanical parts in the chassis have special safety-related characteristics. These characteristics are often passed unnoticed by a visual inspection and the X-RAY RADIATION protection afforded by them cannot necessarily be obtained by using replacement components rated for higher wattage, etc. Replacement parts which have these special safety characteristics are identified in this manual and its supplement electrical components having such features are shaded on the schematic diagram and the parts list. Before replacing any of these components, read the parts list in this manual carefully. The use of substitute replacement parts which do not have the same characteristics as specified in the parts list may create shock, fire, X-RAY RADIATION or other hazards.

#### B+ CHECK

- 1) Prepare the test equipment.
- 2) Use the DC voltameter at DC 200V position to test B+ test point, i.e. B+.
- 3) Connect the power plug to AC 120V/60Hz, turn on the power switch, wait for normal raster, Check  $B^+ = 100V \pm 0.2V$ .

Test point	B+	B1-5V	B2-9V	B3-10V	B4-32V	TH-12V	TH-20V	TH-200V
DC(V)	100	5	9	12	32	12	20(22)	200

# INSTALLATION AND SERVICE ADJUSTMENTS

## GENERAL

In the majority of cases, a color television receiver will need only slight touch – up adjustment upon installation. Check the basic characteristics such as FS,EHV, and focus. Observe the picture for good black and white details without objectionable color shading. If color shading is evident, demagnetize the receiver. If color shading still persists, perform purity and convergence adjustments. This should be all that is necessary to achieve optimum receiver performance.

## FOCUS ADJUSTMENT

Adjust the FOCUS control (on T302) for well defined scanning lines on the picture screen.

## HIGH VOLTAGE CHECK

CAUTION: There is no HIGH VOLTAGE ADJUSTMENT on this chassis. Checking should be done following the steps below.

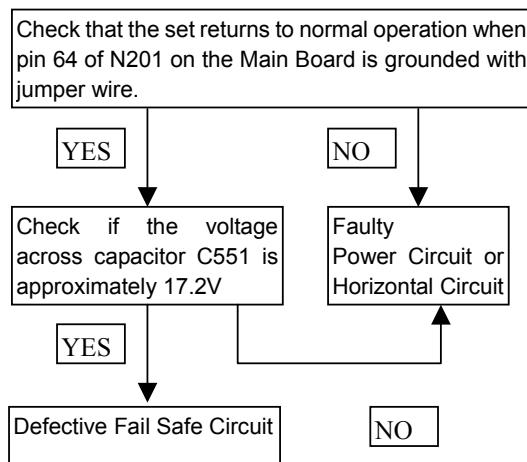

1. Connect an accurate high voltage meter to the second anode of the picture tube.
2. Turn on the receiver. Set the BRIGHTNESS and CONTRAST controls to minimum (zero beam current).
3. High voltage will be measured below 9 (20")KV.
4. Vary the BRIGHTNESS control to both extremes to be sure the high voltage does not exceed the limit under any conditions.

## FS CIRCUIT CHECK

The Fail Safe (FS) circuit check is indispensable for the final check in the servicing. Checking should be done following the steps below.

1. Turn the power switch on and adjust customer controls for normal operation.
2. Temporarily short TP501 and TP502 on the Main Board with a jumper wire. Raster and sound will disappear.
3. The receiver must remain in this state even after removing the jumper wire. This is the evidence that the FS circuit is functioning properly.
4. To obtain a picture again, temporarily turn the receiver off and allow the FS circuit more than 30 seconds to reset. Then turn the power switch on to produce a normal picture.

## Troubleshooting Guide for Fail Safe Circuit

## General instruction

1. This chassis' EEPROM N801 M24C08 should copy standard data, if necessary, deal it with "factory adjustment". If directly use blank EEPROM, should first preset I<sup>2</sup>C data, then go on other common alignment. For factory adjustment method, refer to **The appendix: factory menu**.
2. If without special indication, the alignment is conducted on the below condition:
  - a) AC power supply 120 V/60 Hz.
  - b) The whole unit is preheated for more than 30 min.
3. There is built-in auto degaussing circuit, it will degauss automatically within 1second after turning on.
4. If CRT is with magnetism and affects color purity and convergence, the internal degaussing can not degauss completely, can use degausso to degauss externally. If color purity and convergence is still poor, then do color purity and convergence adjustment.

## Alignment items and procedure

1. B+ voltage check
2. RF AGC voltage adjustment
3. Focus adjustment
4. Screen-grid voltage and white balance adjustment
5. Horizontal,vertical scan center adjustment
6. Horizontal,vertical scan amplitude adjustment
7. Pattern correction adjustment
8. The alignment flow chart see figure below.

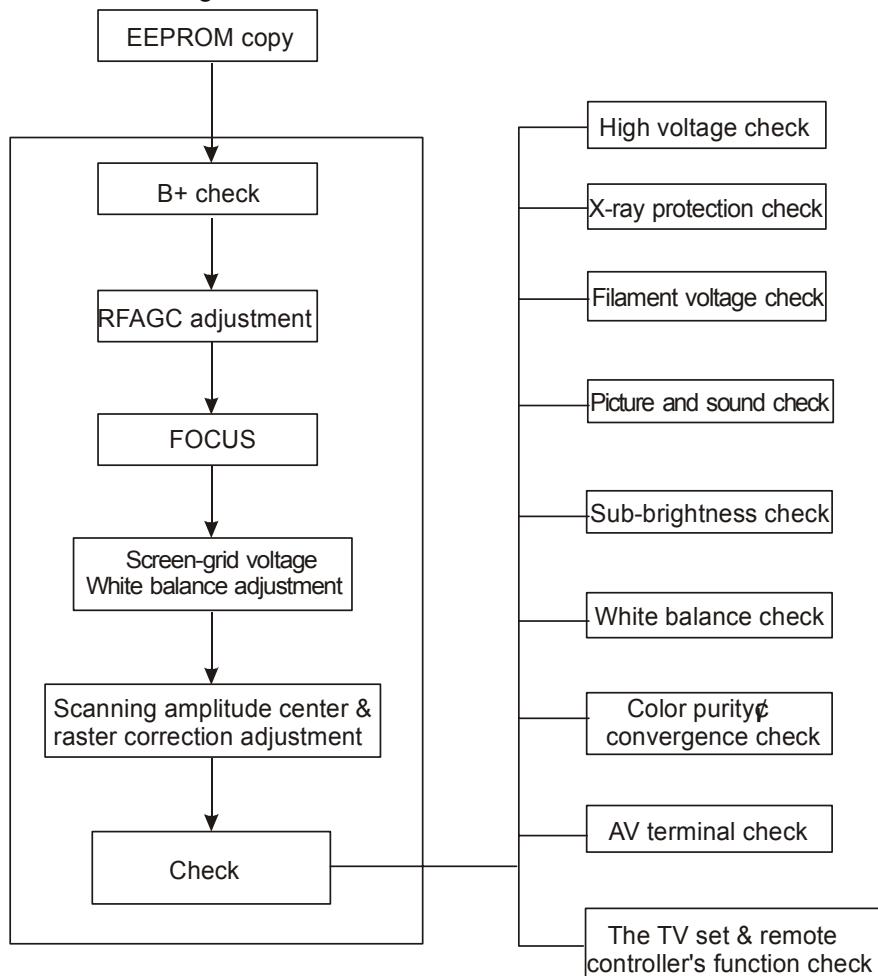

Figure 1: Alignment flow chart

## Factory adjustment mode

### 1. B+ voltage test

- a) Make sure the AC power is 120 V/60 Hz
- b) Connect digital voltmeter to B+ test point, receive A-7 signal, set picture control to "MEMORY 2" state, test B+, the test voltage should be  $100 \text{ V} \pm 0.3 \text{ V}$ .

### 2. AGC adjustment

- a) Receive 60 dB split field A-7 signal.
- b) Use oscilloscope or digital voltmeter to monitor test N201 pin 43 voltage(AGC output).
- c) Press R-AGC button, by making use of  $[\leftarrow][\rightarrow]$  button, increase the value from low to high until the voltage just reach 4.0 V, at this time picture noisy spot should basically disappear, otherwise continue fine tune R-AGC button.

### 3. Focus adjustment

3. 1 Receive A-12 signal, set user control to "MEMORY 2" state.
3. 2 Adjust FBT's focus potentiometer, to make the screen's B area's focus optimum.

### 4. Accelerating electrode adjustment method (use A-7 signal)

- 4.1 Roughly adjust white balance, fix RCUT value, adjust GCUT,BCUT,GDRV,BDRV's value to make white balance basically normal.
- 4.2 Set the color to 0, contrast to 30, use oscilloscope to adjust CRT's red gun's waveform (see below figure), adjust brightness to make the seventh step's (the darkest) DC level be 180V, adjust accelerating electrode to make the seventh step slightly light up (just can separate the seventh step and below dark field).

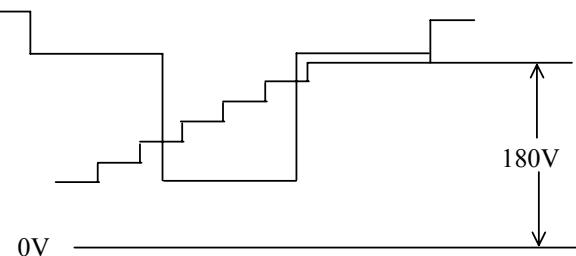

Fig 2: red gun waveform

- 4.3 Fine adjust white balance (color temperature:  $12000\text{K} \pm 8\text{MPCD}$  X= $0.270 \pm 0.008$  Y= $0.283 \pm 0.008$ )
- 4.4 Set contrast,brightness,color all to 0, adjust BRTN to make A-7's upper left 2 lattice slightly light up.

### 5. Horizontal,vertical scan center adjustment

#### 5.1 Item adjustment

VLIN	50Hz V-linearity adjustment
VSC	50Hz Vertical S-correction
VLIS	60Hz V-linearity adjustment
VSS	60Hz Vertical S-correction

#### 5.2 PAL(50 Hz) H-center,V-center adjustment

Receive D35 signal, set user control to "MEMORY 2" state, fine tune V-center VP50, H-center HPOS, to make picture's center be in accordance with screen's center.

#### 5.3 NTSC(60Hz)H-center,V-center adjustment

Receive A6 signal, set user control to "MEMORY 2" state, adjust V-center VP60, H-center HPS to make picture's center be in accordance with screen's center.

## **6. Vertical scan amplitude adjustment**

### **6.1 PAL(50 Hz)V-amplitude adjustment**

Receive D35 signal, set user control to “MEMORY 2” state, adjust V-amplitude HIT, make picture’s upper and lower overscanning be screen size’s 8%.

### **6.2 NTSC(60 Hz)V-amplitude adjustment**

Receive A 12 signal, set user control to “MEMORY 2” state, adjust V-amplitude HITS to make picture’s upper and lower overscanning be screen size’s 8%.

## **Checking point**

### **1. High voltage check**

1.1 Connect high voltage meter to CRT’s second anode and GND.

1.2 Receive A-7 signal, set user control to “MEMORY 1” state, the high voltage should be  $29.0 \text{ kV} \pm 1 \text{ kV}$ .

1.3 When brightness and contrast be set to minimum (zero beam current), the high voltage should not exceed 32 kV.

### **2. CRT filament voltage check**

Receive A-7 signal, set picture control to “MEMORY 2” state, use effective value voltmeter to test CRT filament voltage, the reading should be  $(6.3 \pm 0.3) \text{ Vrms}$ .

### **3. X-ray protection check**

3.1 Receive A-7 signal, set user control to “MEMORY 2” state.

3.2 Short R554(TP501,TP502), X-ray protection circuit should effect.

### **4. Picture and sound check**

4.1 Receive standard TV signal.

4.2 Making use of picture control buttons to check color,contrast,brightness,sharpness,tint’s control function.

4.3 Making use of sound control buttons to check volume control function.

### **5. Sub-brightness check**

Receive A-7 signal, set color ,contrast,brightness all to 0, picture’s left side first grid slightly lights.

**6. This set can produce 28 kinds of testing signal by itself. Press “SLEEP PIC DSP MENU AV” button, every time you press the buttons, one kind of testing signal will be produced. The first fourteen signals are NTSC signal and the other fourteen signals are PAL signal. After these signals are cycled for one time, it will return to original screen.**

### **7. Color purity and convergence check(Use common regulation)**

### **8. AV terminals (AV IN/OUT check)**

### **9. Other control buttons (on the set and on the remote controller) function check.**

## **Preset the following in factory**

1. **Picture menu:** CONTRAST 100  
BRIGHTNESS 50  
COLOR 50  
SHARPNESS 50  
TINT ±00  
PICTURE MEMORY 4  
MODE  
▼MORE

2. **Volume preset to 30.**

3. **Set OSD language to English.**

4. **Color system preset to AUTO.**

5. **TV mode:channel position number 2.**

6. **Firstly press SHOP OUT D/K SPOUT out-factory button on the factory remote controller, “ready” will appear, wait for 8-10 seconds, the preset will be stored.**

## **Factory menu**

1. **Enter into factory menu to operate.**

- 1.1 Press “SLEEP PIC DSP MENU” button(The period of two-press should be within 5 seconds), enter into factory menu.
- 1.2 Use MENU button to scroll the pages(P1,P2,P3).
- 1.3 In factory menu status, press SLEEP button to exit.

2. **Factory menu contents(See below appendix 1.)**

Appendix 1 Factory menu

No .	OSD character	Pre set	Adjustment item	Analogue setting	Input signal	Adjustment methods	Test point
01	RCUT	2F	Dark area white balance	Contrast 0 Color 0 Bright 50	Black/white signal Or horizontal bright line.	Make dark area obtain correct “white color”	screen

## CONVERGENCE MAGNET ASSEMBLY POSITIONING

Convergence magnet assembly and rubber wedges need mechanical positioning. Refer to below figure 1.

## COLOR PURITY ADJUSTMENT

NOTE: Before attempting any purity adjustment, the receiver should be operated for at least fifteen minutes.

1. Demagnetize the picture tube and cabinet using a degaussing coil.
2. Set the CONTRAST and BRIGHTNESS controls to the maximum.
3. Receive PM5515 monochromatic signal (such as G) to provide a green raster on the screen.
4. Loosen the clamp screw holding the yoke, and slide the yoke backward to provide vertical green belt (zone) in the picture screen.
5. Remove the Rubber Wedges.
6. Rotate and spread the tabs of the purity magnet around the neck of the picture tube until the green belt is in the center of the screen. At the same time, center the raster vertically by adjusting the magnet.
7. Move the yoke slowly forward or backward until a uniform green screen is obtained. Tighten the clamp screw of the yoke temporarily.
8. Check the purity of the red and blue raster.
9. Obtain a white raster, referring to “CRT WHITE BALANCE ADJUSTMENT”.
10. Proceed with convergence adjustment.

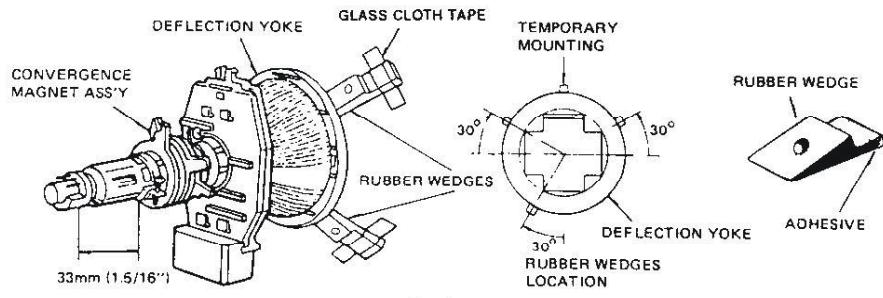

Fig. 1

FIG.3

## CONVERGENCE ADJUSTMENT

NOTE: Before attempting any convergence adjustments, the receiver should be operated for at least fifteen minutes.

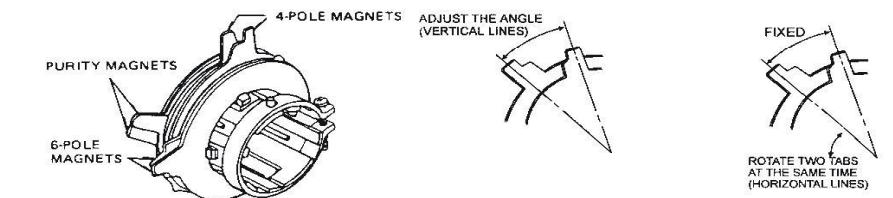

### CENTER CONVERGENCE ADJUSTMENT

1. Receive crosshatch pattern with a color bar signal generator.
2. Adjust the BRIGHTNESS and CONTRAST controls for well defined pattern.
3. Adjust two tabs of the 4-Pole Magnets to change the angle between them (see figure 4) and superimpose red and blue vertical lines in the center area of the picture screen. (see figure 5)
4. Turn the both tabs at the same time keeping the constant angle to superimpose red and blue horizontal lines at the center of the screen.(see figure 5)
5. Adjust two tabs of 6-Pole Magnets to superimpose red/blue line with green one. Adjusting the angle affects the vertical lines and rotating both magnets affects the horizontal lines.
6. Repeat adjustments 3,4,5, keeping in mind red, green and blue movement, because 4-Pole Magnets and 6-Pole Magnets interact and make dot movement complex.

### CIRCUMFERENCE CONVERGENCE ADJUSTMENT

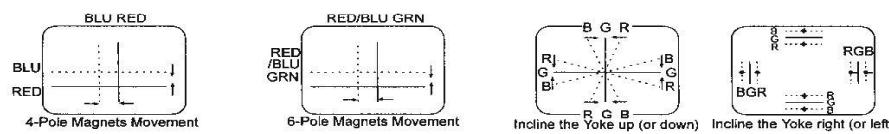

1. Loosen the clamping screw of deflection yoke to allow the yoke to tilt.
2. Put a wedge as shown in figure 1 temporarily. (Do not remove cover paper on adhesive part of the wedge.)
3. Tilt front of the deflection yoke up or down to obtain better convergence in circumference. (See figure 5). Push the mounted wedge into the space between the picture tube and the yoke to hold the yoke temporarily.
4. Put other wedge into bottom space and remove cover paper to stick.
5. Tilt front of the yoke right or left to obtain better convergence in circumference (see figure 5)
6. Keep the yoke position and put another wedge in either upper space. Remove cover paper and stick the wedge on the picture tube to fix the yoke.
7. Detach the temporarily mounted wedge and put it in another upper space. Stick it on the picture tube to fix the yoke.
8. After fixing three wedges, recheck overall convergence. Tighten the screw firmly to fix the yoke tightly in place.

9. Stick three adhesive tapes on wedges as shown in figure 3.

**CAUTION:** All the parts in the schematic diagram marked with red frame and the signs of  $\triangle$  are extremely important a safety. In case of replacement of any part of the components. Be sure to consult the service manual carefully.

1. The schematic diagram is characteristic. The various values in the electric circuits are basic data, which are changeable according to the various basic circuits.
2. Testing waves are obtained by inputting the standard color bar of the signed.
3. Resistance unit is in Ohm, namely:  
 $K=1000 \quad M=1000K$   
 Capacitance unit is in  $\mu F$ .  
 $P=\mu\mu F (\mu=10^{-6})$
4. Unless otherwise noted inside, all resistors are 1/6W, the withstand voltage of all capacitor are 50V.
5. Inductance unit is in  $\mu H$ .
6. The mark  $\square$  in the diagram means Ferrite ring.
7. The symbols of various types of resistors and capacitors are listed as follows:

Carbon Film	
Metal Film	
Potentiometer	
1/2W	
1W	
2W	
3W	
Ceramic	
AC Ceramic	
Polyester	
Polypropylene	
Metal Polyester	
Aluminium	
Tantalum	

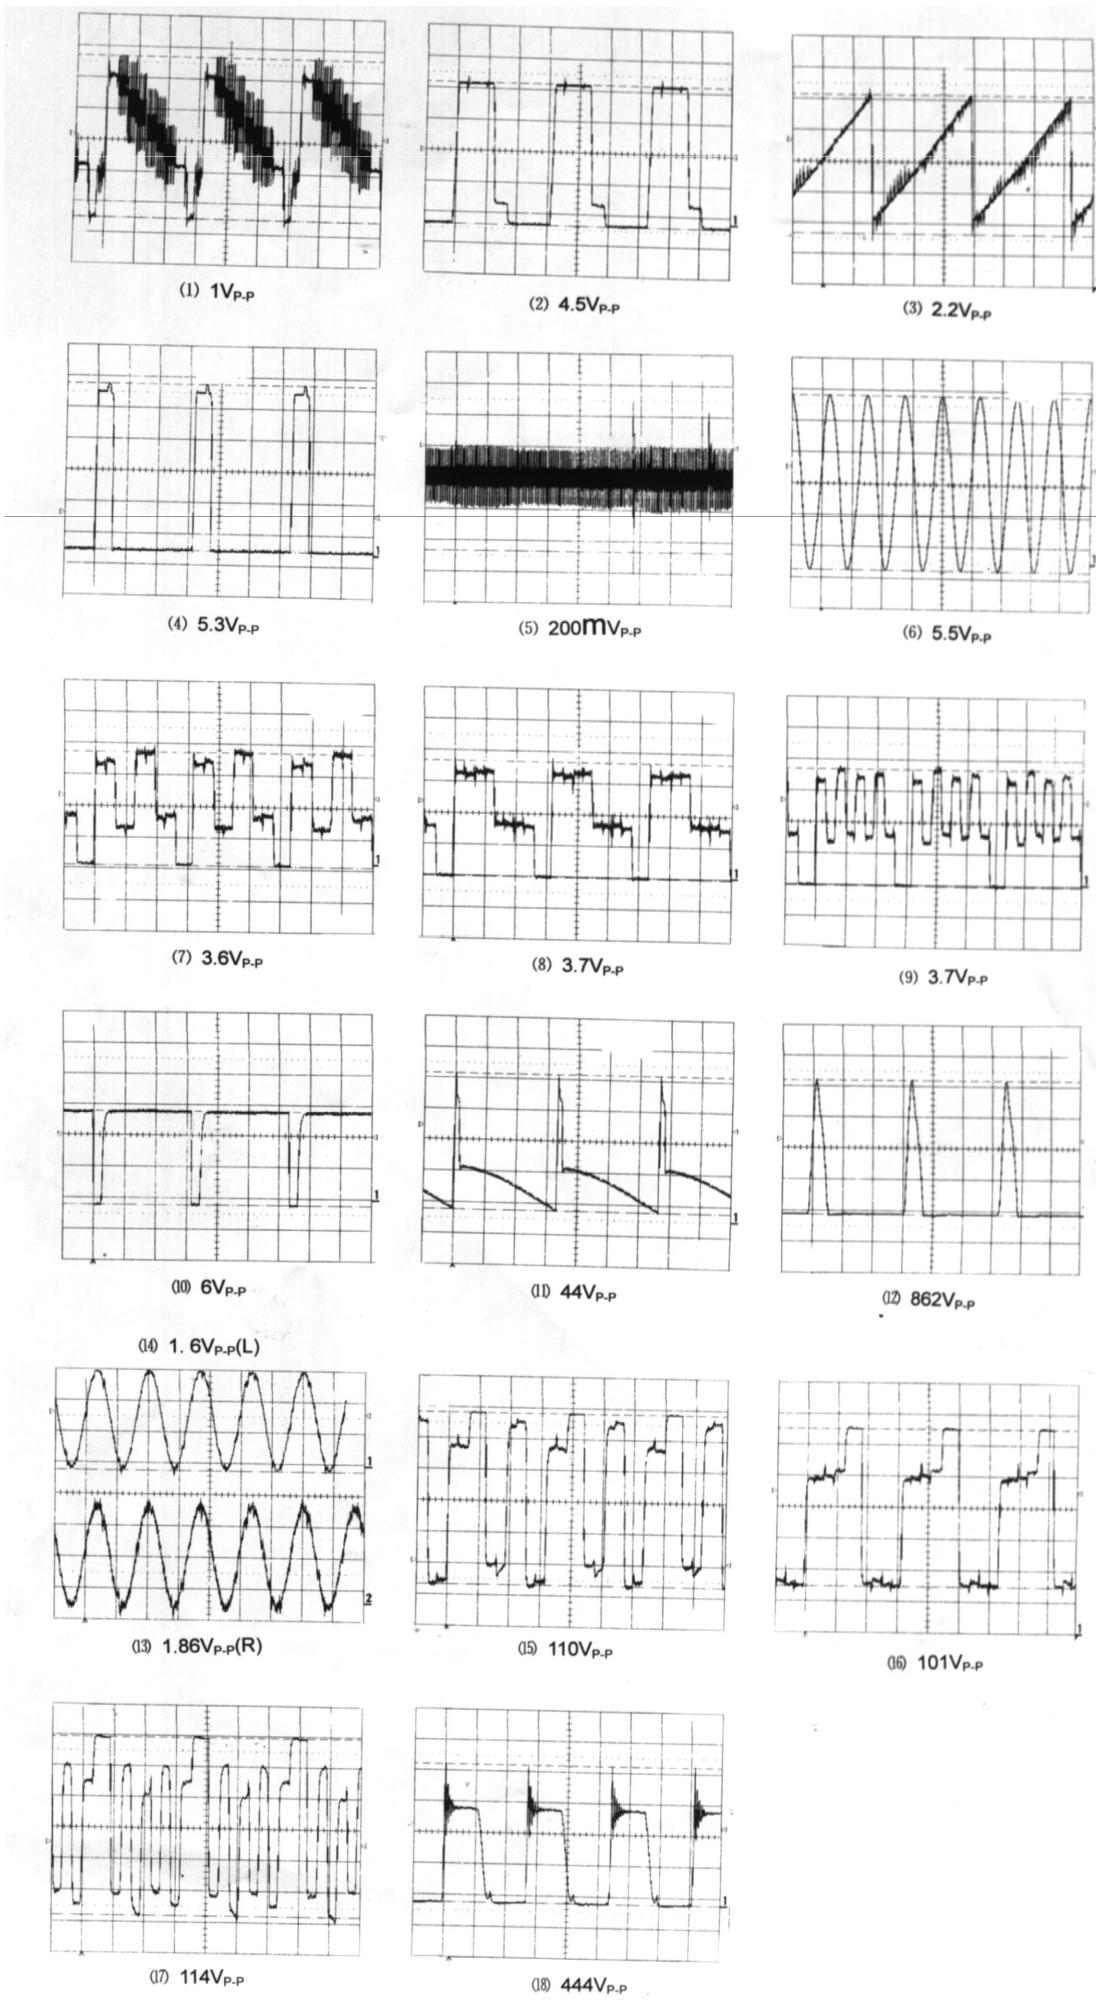

## SCHEMATIC DIAGRAM

82-K2035-0100

2002.04.22

782-K2035-01DL

**WARNING: BEFORE SERVICING THIS CHASSIS, READ THE “X-RAY RADIATION PERCAUTION”, “SAFETY PRECAUTION” AND “RPODUCT SAFETY NOTICE” ON PAGE 1&2 OF THIS MANUAL.**

**CAUTION:** 1. The shaded areas makes in the schematic diagram and the parts list designate components which have special characteristics important for safety and should be replaced only with type identical to those in the original circuit or specified in the parts list. Before replacing any of these components, read carefully the PRODUCT SAFETY NOTICE on page 2.  
 2. Do not degrade the safety of the receiver through improper servicing.
